Are we living a European-wide, tech Cateau-Cambresis?

US-China bilateral meeting, October 2025

We can reverse course, but we must address issues of innovation policy and scale ...

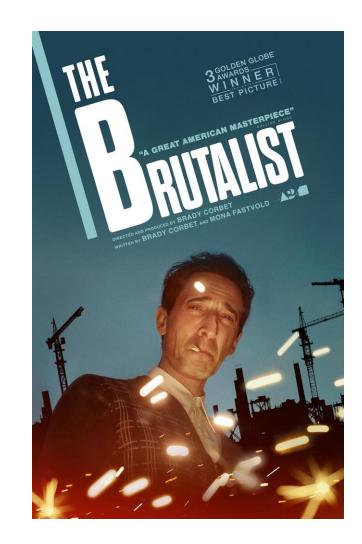

Case Study: AI & Copyright

The question of how copyright law applies to the training of Al models has rightly attracted much debate. Data are the lifeblood of artificial intelligence, and large language models, such as ChatGPT, have mainly been trained on vast amounts of publicly available data sets containing content scraped from the internet.

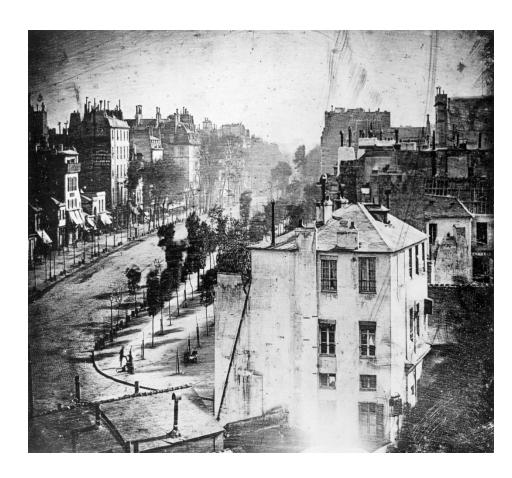

The EU's 2025 Code of Practice for the AI Act sets clear rules on transparency, safety, and security in AI development.

For leading AI providers, these obligations are manageable: models can now auto-report on design, testing, and safeguards, so compliance adds little cost or friction.

Copyright compliance is far harder. Requirements to disclose dataset origins, license protected material, and track a growing number of opt-outs under the 2019 Copyright Directive drastically narrow the pool of trainable data and raise its cost. This puts the EU in a bind: strict enforcement protects creators but risks throttling AI innovation and weakening Europe's competitiveness against the U.S. and China.

les bases les plus avantageuses, et les procédés ne pourront être rendus publics, qu'autant que la souscription atteindrait au moins le nombre de cent; alors, dans le cas contraire, les associés aviseront à un autre mode de publication.

« Si avant l'ouverture de la souscription, on trouvait à traiter pour la vente des procédés, ladite vente ne pourrait être consentie à un prix au-dessous de deux cent mille francs.

« Ainsi fait double et convenu, à Paris, le 43 juin 1837, en la demeure de M. Daguerre, au Diorama, et ont signé

« ISIDORE NIÉPCE. DAGUERRE. »

Après la signature de cet acte définitif, les

deux associés s'occuperent de l'exploitation de la découverte. Comme on vient de le lire dans le traité précédent, on voulait faire appel aux amateurs des beaux-arts et aux capitalistes, pour lancer des actions dans le public. La souscription fut, en effet, ouverte le 15 mars 1838; mais elle n'obtint aucun succès, on ne put réunir aucuns fonds.

Il fut alors décidé que le procédé serait cédé au gouvernement. Il était evident, en effet, que l'invention ne pouvait être sauvegardée par un brevet, car, dès que les principes

Did this trigger the end of Art? No, only of the one they knew...

What is the Blueprint?

Policy Choice	Outcome
State championing innovation (releasing the IP)	Rapid diffusion, global creative explosion
Inventor rewarded directly (pension)	Incentive preserved without monopoly
Science - politics collaboration (Arago's mediation)	Public legitimacy

Imperfect analogies: CERN releasing the World Wide Web in 1993, NIH's Human Genome Project making data public in 2003, Open-source Al

The Tech Competitiveness ills long predate the suite of EU digital regulations...so this as a single explanation falls short ...we must do more and address issues of scale

Bangemann Report 1994

ERISA: Turning savings into innovation capital

- The Employee Retirement Income Security Act Set fiduciary standards for pension funds, creating institutional investors
- 1979 "Prudent Man Rule" revision: pension funds could invest in venture capital
- Made risk capital systemic

Impact:

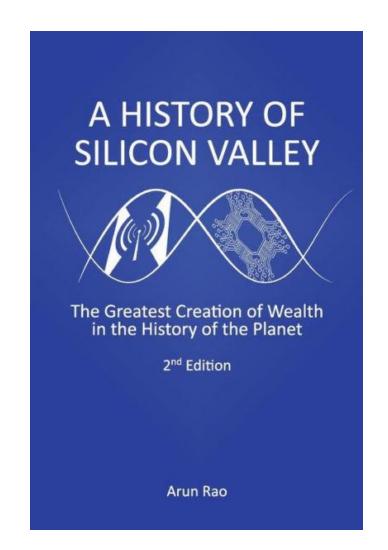

- Institutional money flowed into Kleiner Perkins, Sequoia Capital, and Venrock fueling the Silicon Valley boom (e.g. Apple, Genentech, Intel, Sun)
- Enabled U.S. to pivot from heavy industry to knowledge economy much faster than Japan and Europe.

PENSION FUNDING FOR VC IN 1970s

PENSION FUNDING FOR VC IN 1980s

\$2-100 mn

\$4 bn

NMSIA: Turning regulation in market scale

- Before 1996, U.S. startups raising capital across states had to comply with 50 different "blue sky" laws. Each state imposed its own disclosure, filing, and fee requirements. A company issuing shares in multiple states faced duplicative compliance.
- For example: "If a startup in Seattle issued shares to investors in Washington, California,
 New York, and Texas, it had to comply with all four states' laws." (Ewens & Farre-Mensa,
 2020)
- Congress didn't harmonise the regimes, but bypassed them. The National Securities
 Markets Improvement Act (NSMIA, 1996) created federal pre-emption: SEC-defined private
 offerings automatically exempt from state law.

Impact:

- Late-stage firms became 4× likelier to attract out-of-state investors.
- The private-offering market expanded from \$1.3 bn in 1995 to \$33 bn (2015).

1. Reform Europe's Regulations for a Strong Digital Future

Unleashing growth and innovation will require Europe to launch a bold reform agenda to modernise its digital regulations and unify its markets.

Recommendations

- Accelerate regulatory reforms at the EU level to create a harmonised, innovation-friendly digital single market.
- Fast-track the implementation of a Savings and Investment Union, and a 28th regime (EU INC) to unlock capital and create a foundation for innovation.
- Introduce a Flexicurity regime

Recently released reports on European competitiveness

What is the European Regulatory Deal?

More rules, prevalence of ex ante regulation

Less rules, prevalence of ex post oversight

Lower legal risk

Higher legal risk and Litigation

This Deal is Broken

Ambition

Problem 6: Fragmented measures create obstacles for a cross-border AI single market and threaten the Union's digital sovereignty

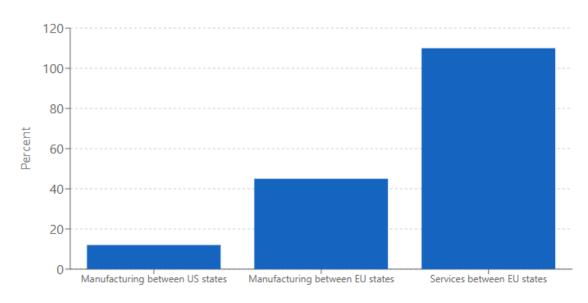

In the absence of a common European framework to address the risks examined before and build trust in AI technology, Member States can be expected to start taking action at a national level to deal with these specific challenges. While national legislation is within the Member States' sovereign competences, ¹⁶³ there is a risk that **diverging national approaches will lead to market fragmentation** and could create obstacles especially for smaller companies to enter multiple national markets and scale up across the EU Single Market. Yet, as noted in section 1.2., AI applications are rapidly increasing in scale. Where advanced models work with billions of parameters, companies need to scale up their models to remain competitive. Since the high mobility of AI producers could lead to a race to the bottom where companies move to Member States with the lightest regulation and serve the entire EU market from there, other Member States may take measures to limit access from other Member States, leading to further market fragmentation.

That is why Member States in general support a common European approach to AI. In a recent position paper 14 Member States recognise the risk of market fragmentation and emphasise that the 'main aim must be to create a common framework where trustworthy and human-centric AI goes hand in hand with innovation, economic growth and competitiveness'. ¹⁶⁴ Earlier, in its conclusions of 9 June 2020, the Council called upon the Commission 'to put forward concrete proposals, taking existing legislation into consideration, which follow a risk-based, proportionate and, if necessary, regulatory approach for artificial intelligence.' ¹⁶⁵

Precautionary principle

The precautionary principle is an approach to risk management, where, if it is possible that a given policy or action might cause harm to the public or the environment and if there is still no scientific agreement on the issue, the policy or action in question should not be carried out. However, the policy or action may be reviewed when more scientific information becomes available. The principle is set out in Article 191 of the Treaty on the Functioning of the European Union (TFEU).

The concept of the precautionary principle was first set out in a European Commission communication adopted in February 2000, which defined the concept and envisaged how it would be applied.

The precautionary principle may only be invoked if there is a potential risk and may not be used to justify arbitrary decisions.

1. Regulatory Pivot

Focus not just on safety but also on value capture and diffusion.

Use market access to enforce openness, not control.

2. Interoperability & Fair Competition

Mandate standardized APIs for foundational models to prevent vendor lock-in.

Require data portability & ban exclusive deals.

PSD2 precedent: Open APIs incentivised fintech innovation.

3. Build Data Advantage

Create sectoral data commons (e.g. Manufacturing-X).

Pool anonymized data for industrial & medical Al training.

4. Reward Sharing & Open Data

Enforce public/open dataset rules; publish EU-wide data map.

Incentivize data release via grants/tax credits.

2. Build Europe's Foundations for the AI Era

Building cheap, abundant and sustainable compute and electricity is necessary for powering Europe's Al-enabled future.

Recommendations

- Secure and maintain a minimum 10% of global compute capacity for Europe to remain competitive in the Al age.
- Complete the Energy Union with harmonised rules and Europe-wide planning, in order to lower electricity costs and improve resilience.
- Initiate a continental energy programme to coordinate the building of new nuclear power plants, and accelerate permissions for renewables, grids and storage.

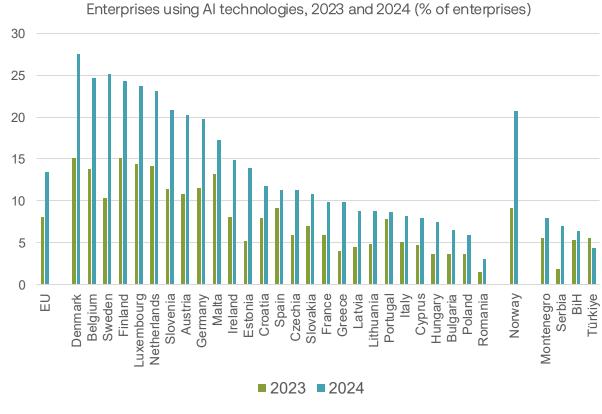

Source: IEA

3. Accelerate AI Adoption to Power Europe's Digital Transformation

Adopting Al across the European economy, supported by open-source innovation, practical applications and world-class talent, will be central to securing Europe's digital competitiveness.

Recommendations

- Accelerate Al adoption by building a trusted, interoperable ecosystem based on Europe's leadership in open data and open-source innovation.
- Promote sector-specific Al-adoption regulation packages that provide regulatory clarity and fast-track approval paths.
- Align university systems with the needs of the innovation economy to attract researchers and strengthen Europe's talent base.

EUROPEAN SOCIAL FUND BUDGET

€127 bn

Autonomy

Universities perform best when they operate independently from bureaucratic control in terms of:

- Freedom to manage budgets and authority to set faculty pay based on merit
- Control over faculty hiring and student admissions and independence in designing their curricula

Competition

Autonomy is most effective when paired with competition. Universities become more innovative and productive when they must:

- Compete for research funding through grants
- Attract top faculty and students

4. Strengthen Europe's Tech Engagement to Increase Global Influence

Actively shaping the Al-enabled world in Europe's own interests – by building, exporting and championing its technological model globally – is key to securing continued global influence.

Recommendations

- Launch a coordinated strategy to export Europe's digital government stack to the world.
- Build new regional technology hubs, staffed with technologists, to promote Europe's tech stack.

01	ERISA-style reform	> mobilising savir	ngs as innovation capita	al
	-		G	

- 28th regime (EU INC) --- > enabling start-ups to scale up
- Flexicurity --- > restoring profitability of VC and offering a safety net for workers
- Digital Government Stack --- > personalised and proactive government services
 - Regulation centred on value capture --- > catalysing AI diffusion
 - University Autonomy and ESF+ --- > accelerating AI reskilling

We can build a European model that is <u>chosen</u> and <u>not</u> <u>just complied with!</u>

"Freedom is not merely the absence of coercion, but the presence of possibility"

Isaiah Berlin, Two Concepts of Liberty
